

# Internet Protocols EBU5403

## The DataLink Layer Part I

Michael Chai (michael.chai@qmul.ac.uk)

Richard Clegg (r.clegg@qmul.ac.uk)

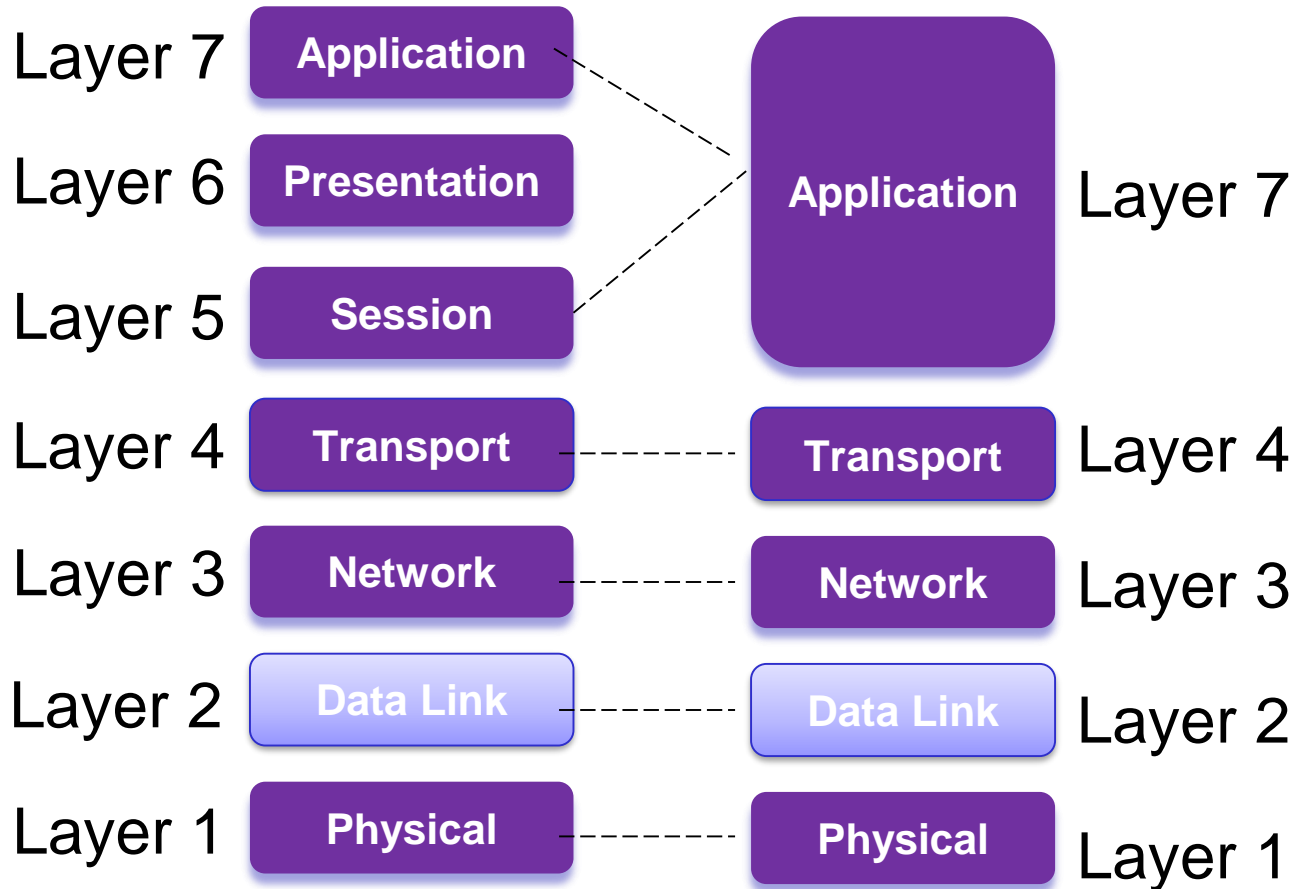

Adnan Kiani (adnankhal@gmail.com)

	Week 1	Week 2	Week 3	Week 4
Telecom	Adnan Kiani	Michael Chai		Adnan Kiani
E-Commerce	Richard Clegg	Michael Chai	Richard Clegg	

# Structure of course

- Week 1 (25<sup>th</sup>-29<sup>th</sup> September)
  - Introduction to IP Networks
  - The Transport layer (part I)
- Week 2 (16<sup>th</sup>-21<sup>st</sup> October)
  - The Transport layer (part II)
  - The Network layer (part I)
  - Class test (open book exam in class)
- Week 3 (20<sup>th</sup>-24<sup>th</sup> November)
  - The Network layer (part II)
  - The Data link layer (part I)
  - Router lab tutorial (assessed labwork after this week)
- Week 4 (18<sup>th</sup>-22<sup>nd</sup> December)
  - The Data link layer (part II)
  - Security and network management
  - Class test

# Data Link Layer

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Link layer: introduction

## *terminology:*

- hosts and routers: **nodes**
- communication channels that connect adjacent nodes along communication path: **links**
  - wired links
  - wireless links
  - LANs
- layer-2 packet: **frame**, encapsulates datagram

*data-link layer* has responsibility of transferring datagram from one node to *physically adjacent* node over a link

# Link layer: context

- datagram transferred by different link protocols over different links:
  - e.g., Ethernet on first link, frame relay on intermediate links, 802.11 on last link
- each link protocol provides different services
  - e.g., may or may not provide rdt over link

## *transportation analogy:*

- trip from Princeton to Lausanne
  - limo: Princeton to JFK
  - plane: JFK to Geneva
  - train: Geneva to Lausanne
- tourist = **datagram**
- transport segment = **communication link**
- transportation mode = **link layer protocol**
- travel agent = **routing algorithm**

# Link layer services

- *framing, link access:*

- encapsulate datagram into frame, adding header, trailer
- channel access if shared medium
- “MAC” addresses used in frame headers to identify source, destination
  - different from IP address!

- *reliable delivery between adjacent nodes*

- we learned how to do this already (transport layer)!
- seldom used on low bit-error link (fiber, some twisted pair)
- wireless links: high error rates
  - *Q:* why both link-level and end-end reliability?

# Link layer services (more)

- *flow control:*
  - pacing between adjacent sending and receiving nodes
- *error detection:*
  - errors caused by signal attenuation, noise.
  - receiver detects presence of errors:
    - signals sender for retransmission or drops frame
- *error correction:*
  - receiver identifies *and corrects* bit error(s) without resorting to retransmission
- *half-duplex and full-duplex*
  - with half duplex, nodes at both ends of link can transmit, but not at same time

# Where is the link layer implemented?

- in each and every host
- link layer implemented in “adaptor” (aka *network interface card* NIC) or on a chip
  - Ethernet card, 802.11 card; Ethernet chipset
  - implements link, physical layer
- attaches into host's system buses
- combination of hardware, software, firmware

# Adaptors communicating

- sending side:
  - encapsulates datagram in frame
  - adds error checking bits, rdt, flow control, etc.
- receiving side
  - looks for errors, rdt, flow control, etc.
  - extracts datagram, passes to upper layer at receiving side

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Error detection

EDC= Error Detection and Correction bits (redundancy)

D = Data protected by error checking, may include header fields

- Error detection not 100% reliable!
  - protocol may miss some errors, but rarely
  - larger EDC field yields better detection and correction

# Parity checking

## *single bit parity:*

- detect single bit errors

## *two-dimensional bit parity:*

- detect and correct single bit errors

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
0	0	1	0	1	0

*no errors*

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
0	0	1	0	1	0

parity error

*correctable  
single bit error*

\* Check out the online interactive exercises for more examples: [http://gaia.cs.umass.edu/kurose\\_ross/interactive/](http://gaia.cs.umass.edu/kurose_ross/interactive/)

# Internet checksum (review)

**goal:** detect “errors” (e.g., flipped bits) in transmitted packet  
(note: used at transport layer only)

## **sender:**

- treat segment contents as sequence of 16-bit integers
- checksum: addition (1's complement sum) of segment contents
- sender puts checksum value into UDP checksum field

## **receiver:**

- compute checksum of received segment
- check if computed checksum equals checksum field value:
  - NO - error detected
  - YES - no error detected.  
*But maybe errors nonetheless?*

# Cyclic redundancy check

- more powerful error-detection coding
- view data bits, **D**, as a binary number
- choose  $r+1$  bit pattern (generator), **G**
- goal: choose  $r$  CRC bits, **R**, such that
  - $\langle D, R \rangle$  exactly divisible by  $G$  (modulo 2)
  - receiver knows  $G$ , divides  $\langle D, R \rangle$  by  $G$ . If non-zero remainder: error detected!
  - can detect all burst errors less than  $r+1$  bits
- widely used in practice (Ethernet, 802.11 WiFi, ATM)

← d bits → ← r bits →

*bit  
pattern*

$$D * 2^r \text{ XOR } R$$

*mathematical  
formula*

# CRC example

want:

$$D \cdot 2^r \text{ XOR } R = nG$$

*equivalently:*

$$D \cdot 2^r = nG \text{ XOR } R$$

*equivalently:*

if we divide  $D \cdot 2^r$  by  $G$ , want remainder  $R$  to satisfy:

$$R = remainder[ \frac{D \cdot 2^r}{G} ]$$

# What have we learned?

- Data link layer has responsibility of transferring datagram from one node to physically adjacent node over a link.
- Key topics we learnt in this part:
  - Data link services: framing, link access and reliable delivery between adjacent nodes.
  - Error detection methods: Error Detection and Correction, Parity Check and Cyclic Redundancy Check.
