7.17 In a source-free, dielectric medium the electric field intensity is given as  $\vec{\mathbf{E}} = C \cos \alpha x \cos(\omega t - \beta z) \vec{\mathbf{a}}_y$  V/m, where C is the amplitude and  $\alpha$  and  $\beta$  are constant quantities. Determine (a) the magnetic field intensity and (b) the electric flux density.

$$E \times ercise 7.17 \quad \vec{E} = C \cos(x) \cos(\omega k - \beta z) \vec{a}_{y} , \quad \sin(\omega \vec{D} = e\vec{E}) \vec{b}_{z} = C \cos(x) \cos(\omega k - \beta z) \vec{a}_{y} , \quad \sin(\omega \vec{D} = 0) \vec{b}_{z} = 0$$

$$From \quad \nabla \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}, \quad \omega e \quad have$$

$$-\frac{\partial \vec{G}}{\partial t} = \beta C \cos(\alpha x) \sin(\omega k - \beta z) \vec{a}_{x} - \alpha C \sin(\alpha x) \cos(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{E} = -\frac{\partial \vec{C}}{\partial t}, \quad \omega e \quad have$$

$$-\frac{\partial \vec{G}}{\partial t} = \beta C \cos(\alpha x) \sin(\omega k - \beta z) \vec{a}_{x} - \alpha C \sin(\alpha x) \cos(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{B} = -\frac{\partial \vec{C}}{\partial t} \cos(\alpha x) \sin(\omega k - \beta z) \vec{a}_{x} + \frac{\alpha C}{\omega} \sin(\alpha x) \sin(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{B} = -\frac{\partial \vec{C}}{\partial t} \cos(\alpha x) \sin(\omega k - \beta z) \vec{a}_{x} + \frac{\alpha C}{\omega} \sin(\alpha x) \sin(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{B} = -\frac{\partial \vec{C}}{\partial t} \cos(\alpha x) \sin(\omega k - \beta z) \vec{a}_{x} + \frac{\alpha C}{\omega} \sin(\alpha x) \sin(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{B} = -\frac{\partial \vec{C}}{\partial t} \cos(\alpha x) \sin(\omega k - \beta z) \vec{a}_{x} + \frac{\partial \vec{C}}{\partial t} \sin(\alpha x) \sin(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{B} = -\frac{\partial \vec{C}}{\partial t} \cos(\alpha x) \cos(\omega k - \beta z) \vec{a}_{x} + \frac{\partial \vec{C}}{\partial t} \sin(\alpha x) \sin(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{C} = -\frac{\partial \vec{C}}{\partial t} \cos(\alpha x) \cos(\omega k - \beta z) \vec{a}_{x} + \frac{\partial \vec{C}}{\partial t} \sin(\alpha x) \sin(\omega k - \beta z) \vec{a}_{z} = 0$$

$$From \quad \nabla \times \vec{C$$

7.29 If the electric field intensity in a source-free, dielectric medium is given as  $\vec{\mathbf{E}} = E_0[\sin(\alpha x - \omega t) + \sin(\alpha x + \omega t)] \vec{\mathbf{a}}_y$  V/m, determine the magnetic field intensity using Maxwell's equation from Faraday's law. What is the displacement current density in the medium?

Problem 7.29 
$$\vec{E} = [E_0 \sin(\alpha x - \omega t) + E_0 \sin(\alpha x + \omega t)] \vec{a}_1 = 2E_0 \sin(\alpha x) \cos(\alpha t) \vec{a}_1 = 2E_0 \sin(\alpha x) \cos(\alpha t) \vec{a}_1 = 2\omega E_0 \sin(\alpha x) \sin(\alpha t) \vec{a}_1 = 2\omega E_0 \sin(\alpha x) \sin(\alpha t) \vec{a}_1 = 2\omega E_0 \sin(\alpha x) \sin(\alpha t) \vec{a}_2 = 2\omega E_0 \cos(\alpha x) \cos(\alpha t) \vec{a}_2 = 2\omega E_0 \cos(\alpha x) \sin(\alpha t) \vec{a}_3 = 2\omega E_0 \cos(\alpha x) \sin(\alpha t) \vec{a}_4 = 2\omega E_0 \cos(\alpha x) \cos(\alpha t) \vec{a}_4 = 2\omega E_0 \cos(\alpha x) \cos(\alpha t) \vec{a}_4 = 2\omega E_0 \cos(\alpha x) \cos(\alpha t) \vec{a}_4 = 2\omega E_0 \cos(\alpha t) \vec{a}_4 = 2\omega E_0 \cos(\alpha t) \vec{a}_4 = 2\omega E_0 \cos(\alpha t) \vec{a}_5 = 2\omega E_0 \cos(\alpha t) \vec{a}$$

7.30 If the magnetic field intensity in a source-free, dielectric medium is given as  $\vec{\mathbf{H}} = H_0[\cos(\alpha x - \omega t) + \cos(\alpha x + \omega t)] \vec{\mathbf{a}}_z$  A/m, determine the electric field intensity using Maxwell's equation from Ampère's law. What is the displacement current density in the medium?

Problem 7.30 
$$\vec{H} = H_0 \left[ \cos(\alpha x - \omega k) + \cos(\alpha x + \omega k) \right] \vec{a}_{\frac{1}{2}}$$

$$= 2H_0 \cos(\alpha x) \cos(\omega k) \vec{a}_{\frac{1}{2}} \quad A/m$$

$$\frac{\partial \vec{D}}{\partial t} = \nabla \times \vec{H} = 2dH_0 \sin(\alpha x) \cos(\omega k) \vec{a}_{\frac{1}{2}} + \vec{a}_{\frac{1}{2}} \quad A/m$$

$$\vec{D} = \frac{2d}{\omega} H_0 \sin(\alpha x) \sin(\omega k) \vec{a}_{\frac{1}{2}} \quad C/m^2$$
and  $\vec{E} = \frac{2d}{\omega} H_0 \sin(\alpha x) \sin(\omega k) \vec{a}_{\frac{1}{2}} \quad V/m$ 

7.33 If  $\vec{\mathbf{E}} = E_0 \cos(\omega t - \beta z) \vec{\mathbf{a}}_x$  V/m in a dielectric medium, show that the electric energy density is equal to the magnetic energy density. Also compute (a) the Poynting vector, (b) the average power density, and (c) the time-average values of the energy densities.

Problem 7.33 
$$\vec{E} = E_0 \cos(\omega t - \beta z) \vec{a}_N$$
,  $\vec{D} = E\vec{E} \Rightarrow \nabla \cdot \vec{D} = 0$ 

$$\frac{\partial \vec{B}}{\partial t} = -\nabla \times \vec{E} = -\beta E_0 \sin(\omega t - \beta z) \vec{a}_N \Rightarrow \vec{B} = \beta E_0 \cos(\omega t - \beta z) \vec{a}_N$$

$$\vec{H} = \frac{\beta E_0}{\omega \mu} \cos(\omega t - \beta z) \vec{a}_N \qquad \nabla \cdot \vec{B} = 0$$
From  $\nabla \times \vec{H} = \frac{\partial \vec{D}}{\partial t} \quad \omega c \quad obtain \quad \beta^2 = \omega^2 \mu \in$ 

$$\omega_c = \frac{1}{2} \vec{D} \cdot \vec{E} = \frac{1}{2} \in E_0^2 \cos^2(\omega t - \beta z) \Rightarrow \langle w_c \rangle = \frac{1}{7} \int_0^7 w_c dt = \frac{1}{4} \in E_0^2 \quad \vec{J}_N \vec{$$

7.39 The electric field intensity in a source-free dielectric medium is given as  $\vec{E} = E \cos(\omega t - ax - kz)\vec{a}_y$  V/m. Find the corresponding  $\vec{H}$  field. What is the necessary condition for these fields to exist? Determine the time-average values of electric energy density, magnetic energy density, and the Poynting vector.

Folder 7.39 
$$\vec{E} = E_0 \cos(\omega t - ax - kz) \vec{a}y$$

$$\nabla x \vec{E} = -\frac{\partial \vec{B}}{\partial t} \Rightarrow \frac{\partial Bx}{\partial t} = \frac{\partial z}{\partial z} Ey = kE_0 \sin(\omega t - ax - kz) \Rightarrow$$

$$B_x = -\frac{kE_0}{\omega} \cos(\omega t - ax - kz)$$
and  $\partial_t B_z = -\frac{\partial z}{\partial x} Ey = -aE_0 \sin(\omega t - ax - kz) \Rightarrow B_z = \frac{aE_0}{\omega} \cos(\omega t - ax - kz)$ 

$$\vec{\nabla} \cdot \vec{B} = 0 \quad \vec{\nabla} \cdot \vec{D} = 0 \quad \text{Source-} \quad \text{free} : \Rightarrow \vec{J} = 0$$

$$\nabla x \vec{H} = \frac{\partial \vec{D}}{\partial t} \Rightarrow \nabla x \vec{B} = \mu E \frac{\partial \vec{E}}{\partial t} \Rightarrow$$

$$-(a^2 + k^2) \stackrel{E}{E_0} \sin(\omega t - ax - kz) \vec{a}y = -\mu E \omega E_0 \sin(\omega t - ax - kz) \vec{a}y$$
or 
$$\omega^2 \mu E = a^2 + k^2 \quad [ \text{Condition for the fields } / 5 \text{ exist} ]$$

$$\omega_e = \int_0^2 E \stackrel{Q}{E} = \int_0^2 E_0 \cos(\omega t - ax - kz) \Rightarrow \langle \omega_e \rangle = \int_0^2 (a^2 + k^2) = \int_0^2 (a^2 + k^2) = \int_0^2 (a^2 + k^2) e^{-ax} (\omega t - ax - kz) \Rightarrow \langle \omega_m \rangle = \frac{E_0^2}{4\mu\omega^2} = \int_0^2 E_0^2 \cos^2(\omega t - ax - kz) \left[ a \vec{a}_x + k \vec{a}_z \right]$$

$$\vec{S} = \vec{E} \cdot \vec{X} \vec{H} = \frac{E_0^2}{\omega \mu} \cos^2(\omega t - ax - kz) \left[ a \vec{a}_x + k \vec{a}_z \right]$$

$$\vec{S} = \vec{E} \cdot \vec{X} \vec{H} = \frac{E_0^2}{\omega \mu} \cos^2(\omega t - ax - kz) \left[ a \vec{a}_x + k \vec{a}_z \right]$$

$$\vec{S} = \vec{E} \cdot \vec{X} \vec{H} = \frac{E_0^2}{\omega \mu} \cos^2(\omega t - ax - kz) \left[ a \vec{a}_x + k \vec{a}_z \right]$$

$$\vec{S} = \vec{E} \cdot \vec{X} \vec{H} = \frac{E_0^2}{\omega \mu} \cos^2(\omega t - ax - kz) \left[ a \vec{a}_x + k \vec{a}_z \right]$$

7.24 The magnetic flux density is typically 0.04 mT near the surface of the earth. What is the magnetic energy density? If the radius of the earth is approximated as 6400 km, and the magnetic flux density is assumed constant up to an altitude equal to the earth's radius, what is the total magnetic energy stored in the region above the earth's surface?

Problem 7.24

$$B = 0.04 \, \text{mT} \quad \phi \quad \omega_{m} = \frac{1}{2} \frac{(0.04 \times 10^{3})^{2}}{4\pi \times 10^{7}} = 636.62 \, \mu J/m^{3}$$
 $W = 636.62 \times 10^{6} \times \frac{417}{3} \left[ 12.8^{3} - 6.4^{3} \right] 10^{2} = 4.89 \times 10^{2} J$ 

7.37 The conductivity of seawater is approximately 0.4 mS/m and its dielectric constant is 81. Determine the frequency at which the magnitude of the displacement current density is equal to the magnitude of the conduction current density. Comment on the electric behavior of seawater at very low and very high frequencies.

Problem 7.37  $J_{=} \sigma E$   $J_{d} = \omega e E$   $\Rightarrow$   $J_{d}/J_{c} = \frac{\omega e}{\sigma}$ For  $J_{d}/J_{c} = 1$ ,  $\omega e = \sigma$   $\Rightarrow$   $f = \frac{\sigma}{a\pi e}$ See water: E = 8160  $\sigma = 0.4 \times 10^{3}$  S/m  $\Rightarrow$  f = 88.889 kHz

When f << 88.889 kHz  $J_{c} > J_{d}$  Conductor

and when f >> 88.889 kHz,  $J_{d} > J_{c}$  poor conductor
